

EventFlow AI

Agentic AI for Smart Event Management Operations

MILESTONE 3

Sponsorship & Incident Management

Project Report

Field	Details
Project Name	EventFlow AI
Milestone	Milestone 3 – Sponsorship & Incident Management
Prepared By	Anumula Akshitha
Organization	Infosys Springboard
Submission Date	25 August 2026

1. Introduction

EventFlow AI is an Intelligent Event Management Platform designed to help event organizers manage every operational aspect of an event — from registration and attendee management to venues, sessions, sponsorships, and on-ground incidents — through a single, unified, AI-assisted dashboard.

Milestone 3 of the project focuses on two critical operational pillars of event management: Sponsorship Management and Incident Management. This milestone extends the platform with an AI Sponsorship Agent that tracks sponsor payments, contracts, and deliverables while generating engagement-based performance insights, and an AI Incident Agent that classifies, prioritizes, and recommends response actions for incidents reported during an event. Together, these modules enable event teams to proactively manage sponsor relationships and respond to operational issues in real time.

2. Milestone Objectives

The following objectives, as defined by the project mentor, were targeted and achieved in this milestone:

1. Design and implement a centralized Sponsor Management module to onboard, view, and manage event sponsors.
2. Enable tiered Sponsorship Package classification (Bronze, Silver, Gold, Platinum) with configurable sponsorship amounts.
3. Implement Payment Status tracking (Pending, Partial, Paid) for each sponsor to monitor revenue collection.
4. Implement Contract Status tracking (Pending, Signed) to monitor legal/agreement progress with sponsors.
5. Build a Sponsor Deliverables tracker to record commitments (branding, sessions, booths, promotions) with deadlines and completion status.
6. Compute a Sponsor Engagement Score and use it to classify sponsor performance (High / Medium / Low).
7. Develop an AI Sponsorship Agent that analyses each sponsor's payment, contract, and deliverable status and produces actionable recommendations.
8. Build an Incident Management module to report, categorize, and track event incidents in real time.
9. Implement automatic Severity-to-Priority mapping and an AI Incident Analysis agent that recommends response actions for each incident.
10. Build an Intelligent Operational Alerts system that automatically raises alerts for High/Critical incidents, supports escalation, and allows alert resolution.

3. Sponsorship Agent

The Sponsorship Agent module allows the event team to onboard sponsors and continuously track their commercial and contractual relationship with the event. Key capabilities include:

3.1 Sponsor Management

Sponsors can be added through a simple form capturing the company name, contact person, email, and phone number, and every registered sponsor is listed in a consolidated 'Registered Sponsors' table showing package, amount, payment, contract, and engagement at a glance.

3.2 Sponsorship Packages

Each sponsor is assigned a package tier — Bronze, Silver, Gold, or Platinum — which determines the sponsorship amount and the level of visibility/benefits offered to the sponsor.

3.3 Payment Tracking

Sponsorship payments are tracked using three states — Payment Pending, Partial Payment, and Paid — allowing the finance/sponsorship team to follow up on outstanding dues.

3.4 Contract Status

Each sponsor record maintains a Contract Status (Pending or Signed) so the team can ensure legal agreements are finalized before the event.

3.5 Deliverables

A dedicated Sponsor Deliverables screen lets the team define commitments owed to each sponsor — such as Main Stage Branding, Promotional Session, Exhibition Booth, Social Media Promotion, or Gifts — each with a name, description, deadline, and status (Pending, In Progress, Completed). Deliverables can be marked completed as they are fulfilled.

← Back to Sponsors

Figure 3.2 – Sponsor Deliverables: tracked commitments with deadlines and completion status

3.6 Engagement Score

Every sponsor is assigned an Engagement Score (0–100%) that reflects how actively the sponsor is participating with the event (promotional activity, session involvement, etc.). This score feeds directly into the AI recommendations and performance classification.

3.7 AI Recommendations

The AI Sponsorship Agent analyses each sponsor's payment status, contract status, deliverable completion rate, and engagement score to generate a risk level and a list of concrete follow-up recommendations, described further in Section 8.

4. Sponsor Performance Analytics

The Sponsor Performance Analytics dashboard aggregates sponsorship data across the event to give the organizing team a real-time financial and engagement overview:

- Total Sponsors – the count of all onboarded sponsors.
- Total Sponsorship – the cumulative sponsorship value committed across all sponsors.
- Paid Sponsors – the number of sponsors who have completed payment in full.
- Pending Payments – the number of sponsors with outstanding dues.
- Average Sponsor Engagement – the mean engagement score across all sponsors, shown as a progress bar.
- Individual Sponsor Performance – a table listing each sponsor's package, amount, payment status, engagement score, and an automatically derived performance label (e.g. Medium Performance).

Figure 4.1 – Sponsor Performance Analytics dashboard with individual sponsor performance table

5. Incident Agent

The Incident Agent enables on-ground staff to report operational issues as they occur and ensures they are routed to the right team with the right urgency. Its core capabilities are:

5.1 Incident Reporting

An incident is reported with a title, description, and the affected area (e.g. Hall A, Main Hall), giving responders precise context on where the issue is occurring.

5.2 Category

Incidents are classified into categories such as Technical or Medical, allowing them to be filtered and routed appropriately.

5.3 Severity

Each incident is assigned a severity level — Low, High, or Critical — reflecting its impact on the event.

5.4 Priority Assignment

Priority (Low/High/Critical) is derived from severity and used to sequence the team's response.

5.5 Responsible Team

Every incident is assigned to a responsible team (e.g. Technical Team, AV Team, Medical Team) for resolution.

5.6 Status Tracking

Incidents move through a clear lifecycle — Open → In Progress → Resolved → Closed — visible directly in the Reported Incidents table.

5.7 AI Incident Analysis

Selecting 'Analyze' on any incident runs the AI Incident Agent, which reviews the category, severity, and priority to generate a set of recommended actions for the responsible team, detailed in Section 8.

The screenshot displays the 'Incident Management' section of the 'EventFlow AI' platform. The top navigation bar includes links to Dashboard, Registration, Attendees, Venues, Speakers, Sessions, Incidents, Operational Alerts, Analytical Reports, Sponsors, Sponsor Analytics, Check-in, Analytics, and AI Insights. The main content area is titled 'Incident Management' with the subtitle 'Report, track, prioritize and manage event incidents.' Below this is a 'Report New Incident' form. The form includes fields for 'Incident Title' (with a dropdown menu), 'Affected Area' (with a dropdown menu), 'Incident Description' (a text area), 'Category' (a dropdown menu), 'Severity' (a dropdown menu), and 'Responsible Team' (a dropdown menu). A 'Report Incident' button is located at the bottom of the form. Below the form is a table titled 'Reported Incidents' with columns for ID, Title, Category, Severity, Priority, Responsible Team, Status, and Action. The table contains six rows of incident data.

ID	Title	Category	Severity	Priority	Responsible Team	Status	Action
#7	Sound System Failure	Technical	High	High	AV Team	Open	Analyze Start
#6	WiFi Slow	Technical	Low	Low	Technical Team	Open	Analyze Start
#5	Medical Emergency	Medical	Critical	Critical	Medical Team	Open	Analyze Start
#4	Network Failure	Technical	High	High	Technical Team	Open	Analyze Start
#3	Network Failure	Technical	High	High	Technical Team	Closed	Analyze
#2	Medical Emergency	Medical	Critical	Critical	Medical Team	Closed	Analyze

Figure 5.1 – Incident Management: Report New Incident form and Reported Incidents table

6. Incident Management Workflow

Every incident reported on the platform follows a consistent, predictable workflow:

Step	Description
1. Report Incident	On-ground staff logs the incident with title, category, severity, and affected area.
2. Automatic Priority Assignment	The system derives a priority (Low/Medium/High/Critical) directly from severity.
3. AI Analysis	The Incident Agent reviews the incident and generates recommended actions.
4. Recommended Actions	The responsible team receives actionable, AI-generated guidance.
5. Start → Resolve (Escalate if Critical)	The team progresses the incident through its lifecycle; Critical incidents are automatically escalated.

Figure 6.1 – End-to-end incident management workflow

When an incident is reported, the system automatically derives a priority from its severity. The AI Incident Analysis agent then reviews the incident and produces recommended actions for the responsible team. The team can mark the incident In Progress ('Start') and later Resolve it; High and Critical incidents additionally trigger an entry in Operational Alerts, ensuring visibility until they are formally resolved and closed.

7. Intelligent Operational Alerts

To ensure urgent issues are never missed, the platform automatically raises Operational Alerts whenever a High or Critical severity incident is reported:

- Alerts are generated automatically — no manual step is required — the moment a High or Critical incident is logged.
- Each alert records the alert message, type, priority, status (Active/Resolved), and creation timestamp.
- All alerts are consolidated in the Operational Alerts dashboard for real-time visibility across the event team.
- Alerts can be marked Resolved once the underlying incident has been addressed, closing the loop between incident response and alerting.

ID	Alert Message	Type	Priority	Status	Created At	Action
#4	High Alert: Projector reported in Hall A.	Incident	High	Active	25-08-2026 14:15	Resolve
#3	High Alert: Sound System Failure reported in the event area.	Incident	High	Active	21-08-2026 15:56	Resolve
#2	Critical Alert: Medical Emergency reported in Main Hall.	Incident	Critical	Active	21-08-2026 15:52	Resolve
#1	High Alert: Network Failure reported in Main Hall.	Incident	High	Resolved	21-08-2026 15:18	Resolved

Figure 7.1 – Operational Alerts dashboard showing active and resolved alerts

8. AI-Based Recommendations

8.1 Sponsor Recommendations

For each sponsor, the AI Sponsorship Agent evaluates payment status, contract status, deliverable completion, and engagement score, then produces targeted follow-up actions, for example:

- Follow up regarding pending sponsorship payment.
- Follow up regarding the sponsorship contract.
- Complete pending deliverable(s).
- Increase sponsor engagement through promotional activities.

It also computes an overall Risk Level (e.g. High) and a Completion percentage across all deliverables, giving the sponsorship team a quick view of which sponsors need attention.

Figure 8.1 – AI Sponsorship Agent analysis with risk level and recommendations

8.2 Incident Recommended Actions

For each reported incident, the AI Incident Agent generates response guidance based on category, severity, and priority, for example:

- Immediately inspect the affected technical equipment.
- Assign the technical or AV team for quick resolution.
- High priority: resolve this incident as soon as possible.

Figure 8.2 – AI Incident Analysis with category, severity, priority, and recommended actions

9. Real-Time Monitoring Dashboards

EventFlow AI provides real-time dashboards so the event team always has an up-to-date operational picture. The key monitoring screens delivered in this milestone are summarized below.

9.1 Sponsor Performance Analytics

Figure 9.1 – Sponsor Performance Analytics dashboard

9.2 Incident Management

Figure 9.2 – Incident Management dashboard

9.3 AI Incident Analysis

Figure 9.3 – AI Incident Analysis screen

9.4 Operational Alerts

Figure 9.4 – Operational Alerts dashboard

10. Incident Prioritization and Escalation

Incident severity directly determines priority and whether an operational alert and escalation are triggered:

Severity	Priority	Operational Alert	Escalation
Low	Low	Not generated	None
Medium	Medium	Not generated	None
High	High	Generated	Team notified
Critical	Critical	Generated	Automatic escalation

Table 10.1 – Severity-to-priority mapping and escalation rules

Once an incident is opened, it can be moved to In Progress via 'Start', then marked Resolved. Resolved incidents can subsequently be Closed, completing the lifecycle shown below.

Reported Incidents							
ID	Title	Category	Severity	Priority	Responsible Team	Status	Action
#8	Projector	Technical	High	High	Technical Team	Open	Analyze Start
#7	Sound System Failure	Technical	High	High	AV Team	Open	Analyze Start
#6	WiFi Slow	Technical	Low	Low	Technical Team	Open	Analyze Start
#5	Medical Emergency	Medical	Critical	Critical	Medical Team	Open	Analyze Start
#4	Network Failure	Technical	High	High	Technical Team	Open	Analyze Start
#3	Network Failure	Technical	High	High	Technical Team	Closed	Analyze
#2	Medical Emergency	Medical	Critical	Critical	Medical Team	Closed	Analyze
#1	Projector Not Working	Technical	High	High	AV Team	In Progress	Analyze Resolve

Figure 10.1 – Incident opened and progressing (Start / Resolve actions available)

Reported Incidents							
ID	Title	Category	Severity	Priority	Responsible Team	Status	Action
#8	Projector	Technical	High	High	Technical Team	Open	Analyze Start
#7	Sound System Failure	Technical	High	High	AV Team	Open	Analyze Start
#6	WiFi Slow	Technical	Low	Low	Technical Team	Open	Analyze Start
#5	Medical Emergency	Medical	Critical	Critical	Medical Team	Open	Analyze Start
#4	Network Failure	Technical	High	High	Technical Team	Open	Analyze Start
#3	Network Failure	Technical	High	High	Technical Team	Closed	Analyze
#2	Medical Emergency	Medical	Critical	Critical	Medical Team	Closed	Analyze
#1	Projector Not Working	Technical	High	High	AV Team	Closed	Analyze

Figure 10.2 – Incident fully Closed after resolution

11. Analytical Reports

The Analytical Reports screen consolidates sponsorship, incident, and operational alert data into a single management-level summary, giving stakeholders a holistic view of event health without navigating multiple screens. It reports total sponsors and sponsorship value, paid vs. pending sponsors, average sponsor engagement, total/open/high-severity/critical/closed incidents, and total/active/resolved alerts, alongside an AI-generated Operational Summary highlighting items that need attention.

Figure 11.1 – Analytical Reports: consolidated sponsorship, incident, and alert analytics

12. Technologies Used

- Python – core application and AI agent logic
- Flask – web application framework and routing
- SQLAlchemy / SQLite – ORM and relational database for persisting sponsors, incidents, deliverables, and alerts
- HTML5 – page structure and templating
- CSS3 – custom styling
- Bootstrap – responsive UI components and layout
- Jinja2 – server-side templating engine for dynamic rendering

13. Coding Implementation

This section presents the major backend implementation components developed for the EventFlow AI – Sponsorship & Incident Management module. The application was developed using Python, Flask, SQLAlchemy, HTML, CSS and Bootstrap.

13.1 Sponsorship Management Implementation

The sponsorship module allows event organizers to add and manage sponsor information, including sponsorship packages, amounts, payment status and engagement.

Sponsorship Agent Integration

```
@app.route("/add_sponsor", methods=["POST"])
def add_sponsor():

    name = request.form.get("name")
    package = request.form.get("package")
    amount = request.form.get("amount")
    payment_status = request.form.get("payment_status")
    engagement_score = request.form.get(
        "engagement_score",
        0
    )

    sponsor = Sponsor(
        name=name,
        package=package,
        amount=float(amount),
        payment_status=payment_status,
        engagement_score=float(engagement_score)
    )

    db.session.add(sponsor)
    db.session.commit()

    return redirect("/sponsors")
```

This code creates and stores a new sponsor in the database.

13.2 AI-Powered Sponsorship Agent

The Sponsorship Agent analyzes sponsor information and generates performance insights and recommendations.

```
def analyze_sponsor(sponsor):

    recommendations = []

    if sponsor.payment_status == "Pending":

        recommendations.append(
            "Follow up with the sponsor regarding the pending payment."
        )
```

```

if sponsor.engagement_score < 50:

    recommendations.append(
        "Increase sponsor engagement through promotions and event activities."
    )

if sponsor.engagement_score >= 80:

    performance = "Excellent"

elif sponsor.engagement_score >= 60:

    performance = "Good"

else:

    performance = "Needs Attention"

return {
    "performance": performance,
    "recommendations": recommendations
}

```

The agent evaluates:

- Sponsor payment status
- Engagement level
- Sponsor performance
- Potential risks
- Recommended actions

13.3 Sponsor Performance Analytics

The sponsor analytics module calculates overall sponsorship performance.

```

@app.route("/sponsor_analytics")
def sponsor_analytics():

    sponsors = Sponsor.query.all()

    total_sponsors = len(sponsors)

    total_sponsorship = sum(
        sponsor.amount for sponsor in sponsors
    )

    paid_sponsors = sum(
        1 for sponsor in sponsors
        if sponsor.payment_status == "Paid"
    )

    pending_payments = sum(
        1 for sponsor in sponsors
        if sponsor.payment_status == "Pending"
    )

```

```

    )

    if total_sponsors > 0:

        average_engagement = sum(
            sponsor.engagement_score
            for sponsor in sponsors
        ) / total_sponsors

    else:

        average_engagement = 0

    return render_template(
        "sponsor_analytics.html",
        total_sponsors=total_sponsors,
        total_sponsorship=total_sponsorship,
        paid_sponsors=paid_sponsors,
        pending_payments=pending_payments,
        average_engagement=average_engagement,
        sponsors=sponsors
    )

```

This dashboard provides real-time monitoring of:

- Total sponsors
- Total sponsorship amount
- Paid sponsors
- Pending payments
- Average sponsor engagement
- Individual sponsor performance

13.4 Incident Management Implementation

The incident management module allows organizers to report and track incidents occurring during an event.

Incident Listing Route

```

@app.route("/incidents")
def incidents():

    incidents_list = Incident.query.order_by(
        Incident.reported_at.desc()
    ).all()

    return render_template(
        "incidents.html",
        incidents=incidents_list
    )

```

This displays all reported incidents in descending order of reporting time.

13.5 Automatic Incident Prioritization

When an incident is reported, its priority is automatically assigned based on severity.

```
@app.route("/add_incident", methods=["POST"])
def add_incident():

    severity = request.form.get("severity")

    priority_map = {
        "Low": "Low",
        "Medium": "Medium",
        "High": "High",
        "Critical": "Critical"
    }

    priority = priority_map.get(
        severity,
        "Medium"
    )

    incident = Incident(
        title=request.form.get("title"),
        description=request.form.get("description"),
        category=request.form.get("category"),
        severity=severity,
        priority=priority,
        affected_area=request.form.get("affected_area"),
        responsible_team=request.form.get(
            "responsible_team"
        ),
        status="Open"
    )

    db.session.add(incident)
    db.session.commit()
```

This ensures that incidents are automatically categorized and prioritized.

13.6 Automatic Incident Escalation

Critical incidents are automatically escalated for immediate action.

```
if incident.severity == "Critical":

    incident.escalation_status = "Escalated"

    incident.recommended_action = (
        "Critical incident automatically escalated "
        "to the Event Management Team for immediate action."
    )

    db.session.commit()
```

This improves operational efficiency by ensuring that critical situations receive immediate attention.

13.7 Automatic Operational Alert Generation

High and Critical incidents automatically generate operational alerts.

```
if incident.severity in ["High", "Critical"]:

    alert_message = (
        f"{incident.severity} Alert: "
        f"{incident.title} reported in "
        f"{incident.affected_area or 'the event area'}."
    )

    alert = OperationalAlert(
        message=alert_message,
        alert_type="Incident",
        priority=incident.priority,
        related_incident_id=incident.id,
        status="Active"
    )

    db.session.add(alert)
    db.session.commit()

return redirect("/incidents")
```

Example

If a High Severity Network Failure occurs in the Main Hall, the system automatically generates:

High Alert: Network Failure reported in Main Hall.

This alert is then displayed on the Operational Alerts Dashboard.

13.8 AI-Powered Incident Agent

The Incident Agent analyzes the incident details and provides recommended actions.

```
def analyze_incident(incident):

    recommendations = []

    if incident.category == "Technical":

        recommendations.append(
            "Notify the technical team immediately."
        )

    elif incident.category == "Medical":

        recommendations.append(
            "Alert the medical response team immediately."
        )

        recommendations.append(
            "Provide first aid and emergency assistance."
        )

    elif incident.category == "Security":
```

```

        recommendations.append(
            "Notify the security team and secure the affected area."
        )

    if incident.severity == "Critical":

        recommendations.append(
            "CRITICAL: Escalate immediately to the Event Manager."
        )

    return recommendations

```

The Incident Agent considers:

- Incident category
- Severity
- Priority
- Affected area
- Responsible team
- Current incident status

It then provides AI-based recommended actions.

13.9 Incident Workflow Management

The system supports the following incident workflow:

Stage	Status
Incident Reported	—
Assigned to Responsible Team	Open
Work begins	In Progress
Issue Resolved	Resolved
Workflow complete	Closed

A route is used to start incident processing:

```

@app.route("/incident/<int:incident_id>/start")
def start_incident(incident_id):

    incident = Incident.query.get_or_404(
        incident_id
    )

    incident.status = "In Progress"

    db.session.commit()

    return redirect("/incidents")

```

This allows incidents to move through a structured management lifecycle.

13.10 Operational Alert Resolution

The system also allows active alerts to be resolved after the associated incident is handled.

```
@app.route("/alerts/<int:alert_id>/resolve")
def resolve_alert(alert_id):

    alert = OperationalAlert.query.get_or_404(
        alert_id
    )

    alert.status = "Resolved"

    db.session.commit()

    return redirect("/operational_alerts")
```

This prevents old alerts from remaining active after an issue has been resolved.

13.11 AI-Based Recommendations

The system uses AI-style rule-based agents to provide intelligent recommendations.

Sponsorship Recommendations

Examples include:

- Follow up on pending payments.
- Increase sponsor engagement.
- Improve deliverable completion.
- Provide additional promotional opportunities.
- Identify sponsors requiring attention.

Incident Recommendations

Examples include:

- Notify the responsible team.
- Secure the affected area.
- Provide immediate medical assistance.
- Escalate critical incidents.
- Inform the Event Management Team.

13.12 Real-Time Monitoring Dashboards

The project includes the following monitoring dashboards:

Sponsor Analytics Dashboard

Tracks:

- Total sponsors
- Total sponsorship revenue

- Paid sponsors
- Pending payments
- Average sponsor engagement
- Individual sponsor performance

Incident Dashboard

Tracks:

- Incident title
- Category
- Severity
- Priority
- Responsible team
- Current status

Operational Alerts Dashboard

Tracks:

- Alert ID
- Alert message
- Alert type
- Priority
- Alert status
- Created date and time

13.13 Overall System Flow

Sponsorship Flow	Incident Flow
Sponsor Data	Incident Reported
→ Sponsorship Agent	→ Incident Agent Analysis
→ Performance Analysis	→ Automatic Prioritization
→ AI Recommendations	→ Responsible Team Assignment
→ Sponsor Analytics Dashboard	→ High/Critical Incident? → Operational Alert Generated
	→ Critical Incident Escalated
	→ AI Recommended Actions
	→ Incident Resolution and Closure

14. Results and Achievements

All milestone objectives were successfully implemented and verified in the running application:

Objective	Status
Centralized Sponsor Management module	Completed
Tiered sponsorship packages with amount tracking	Completed
Payment status tracking (Pending/Partial/Paid)	Completed
Contract status tracking (Pending/Signed)	Completed
Sponsor deliverables tracker with deadlines	Completed
Sponsor engagement score & performance classification	Completed
AI Sponsorship Agent with recommendations	Completed
Incident reporting, categorization & tracking	Completed
Automatic priority mapping & AI incident analysis	Completed
Intelligent operational alerts with escalation	Completed
AI-powered Sponsorship Agent developed	Completed
AI-powered Incident Agent developed	Completed
Real-time event monitoring & operational efficiency improved	Completed

Table 14.1 – Milestone objectives vs. completion status

15. Conclusion

Milestone 3 successfully extends EventFlow AI with two AI-assisted operational modules — Sponsorship Management and Incident Management — that give event organizers real-time visibility and proactive guidance. The Sponsorship Agent ensures no sponsor payment, contract, or deliverable falls through the cracks, while the Incident Agent, combined with automatic prioritization and Operational Alerts, ensures that urgent on-ground issues are surfaced and escalated immediately.

The implemented Sponsorship Agent provides sponsor performance insights and recommendations, while the Incident Agent supports incident analysis, prioritization and recommended actions. The system also automates high-priority operational alerts and critical incident escalation, helping event organizers respond quickly to important situations. Real-time dashboards provide centralized monitoring of sponsor performance, incidents and operational alerts.

Together with the consolidated Analytical Reports dashboard, these modules move EventFlow AI closer to its goal of being a truly intelligent, end-to-end event management platform, and lay a solid foundation for further AI-driven enhancements in subsequent milestones.
